Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
cc multimer; a diagnostically useful HPRG-related composition, comprising the diagnostically labeled polypeptide, peptide or peptide multimer and a carrier; an antibody specific for an epptiope of HPRG that is present in the HFVP domain of human or rabbit HPRG, and which binds to HPRG or to any of the domain of human or rabbit HPRG, and which binds to HPRG or to any of the domain, or an antigen-binding fragment of the antibody; a method for the domain, or an antigen-binding fragment of the antibody; a method for that in the formation of the inhibiting cell invasion, cell proliferation or angiogenesis, a method for treating a subject having a disease or condition associated with undesired cell migration, invasion, proliferation, or angiogenesis; a method of detecting the presence of HPRG or its clavage product or its peptide in captural than or inhibiting angiogenesis in a subject; a method of detecting the presence of HPRG or its clavage product or its peptide in captural sample; isolated nucleic acids encoding the polypeptide, or peptide or peptide multimer; an expression vector; transformed or transfected cells; a method of providing to a cell, tissue or organ an angiogenesis-inhibitory amount of HPRG, an HFVP domain of HPRG or its pentabeptide, or the peptide multimer; an affinity ligand useful for binding to, or isolating, an HPRG-binding molecule, or isolating molecule, comprising the polypeptide, peptide or peptide compositions and methods are useful in diagnosing or tracting a disease or condition associated with undesired cell migration, invasion, for condition associated with undesired cell migration, invasion, or reating mantenes. HPRG-binding molecule, or isolating or erriching a disease or conditions and methods are useful in inhibiting the growth of primary temmours or metastases, and may also be used in treating neurodegenerative conditions or metastases, and any also be used in treating antibode or periode and any also be used in treating and endinged and and any also be used in tracery and an er
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       stimulators of angiogenesis and are useful for promoting neovascularization in pertinent disease states, and in various
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  immunoassays

The present sequence is the protein sequence of human histidine proline rich glycoprotein (HPRG), a proteinaceous metal chelator that can be used to inhibit anglogenais and treat cancer. Claimed anti-anglogenic polypeptides or peptides comprise: the histidine-proline-rich (H/P) domain (see ABB79806) of human HPRG; an H/P domain of rabbit HPRG (see ABB79807); a variant of these that is capable of inhibiting anglogenesis, candothelial cell proliferation or endothelial tube formation in vitro or in vivo; or a pentapeptide having the generic sequence given in ABB79808. Also claimed are: chemically synthesised or recombinantly produced peptide multimers; a diagnostically or therapeutically labeled anti-anglogenic polypeptide, peptide or peptide multimer; a diagnostically useful HPRG-related composition, comprising the diagnostically labeled propeptide, peptide or peptide multimer; and antibody specific for an epitope of HPRG that is present in the H/P domain of human or rabbit HPRG, and which binds to HPRG or to any of the domains in a which inhibits the fartime and or articly of the domains in car an antigen-binding fragment of the antibody; a method for inhibiting or inhibiting condition associated with undesired cell migration, invasion, or anglogenesis, a method of stimulating or inhibiting anglogenesis, a method of detecting the presence of HPRG or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New histidine-proline rich glycoprotein (HPRG) polypeptide, useful for diagnosing or treating diseases associated with undesired cell migration, invasion, proliferation, or angiogenesis, e.g. cancer, atherosclerosis.
                                                                                                                                                                                                                                                                                       Histidine proline rich glycoprotein; HPRG; human; antiangiogenic; cytostatic; antiatarterioscelerctic; antiinflammatory; antidiabetic; gynaecological; antiarthritic; antialcer; osteopathic; antitumour; ophthalmological; noctropic; neuroprotective; antiparkinsonian; chelator.

its cleavage product or its peptide in a biological sample; isolated mucleic acids encoding the polypeptide, peptide or peptide multimer; an expression vector; transformed or transfected cells; a method of providing to a cell, tissue or organ an angiogenesis-inhibitory amount of HPRG, an H/P domain of HPRG or its pentapeptide, or the peptide multimer; an a faffinity ligand useful for binding to, or isolating, an HPRG-binding polypeptide, peptide or peptide multimer; immobilised to a solid support or carrier; and a method of isolating HPRG-binding molecule, or isolating or enriching cells expressing HPRG-binding site or receptor, from a complex mixture. The compositions and methods are useful in diagnosing or treating a disease or condition associated with undesired cell migration,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     409
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Composition comprising several cDNAs that are differentially expressed in

                                                                                                                                                                                                                                                                                                                                                                                                invasion, proliferation, or angiogenesis, such as cancer, atherosclerosis, diabetic retinopathy, inflammation, endometriosis, arthritis, peptic ulcers or fractures. HPRG is especially useful in inhibiting the growth of practures or meteatases, and may also be used in treating neurodegenerative diseases like Alzheimer's disease, parkinson's disease, and amyotrophic lateral sclerosis. The antibodies are stimulators of angiogenesis and are useful for promoting neovascularization in pertinent disease states, and in various

The invention relates to a composition comprising several cDNAs that are differentially expressed in a liver disorder. The composition is useful for treating liver disorder such as hyperlipidaemia, hypertension, type II diabetes, tumours of the liver and disorders of the inflammatory and immune response. The composition is useful for a high-throughput method of screening several molecules or compounds to identify a ligand which specifically binds a CDNA. A protein encoded by the CDNA is useful for a high-throughput method for using a protein to screen several molecules or compounds to identify at least one ligand which specifically binds the protein which involves combining the protein encoded by the CDNA with several of molecules or compounds under conditions to allow specific binding, and detecting specific binding between the protein and a molecule or compound, therefore identifying a ligand which specifically binds the protein. The composition is useful for detecting and quantifying differential gene expression, can be used in gene therapy, to formulate prognosis and to design a treatment regimen and to monitor the efficacy of treatment. The present sequence represents the amino acid is sequence of a protein encoded by a CDNA differentially expressed in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                469

The present sequence is the protein sequence of rabbit histidine proline rich glycoprotein (HPRG), a proteinaceous chelator that can be used to inhibit angiogenesis and treat cancer. Claimed anti-angiogenic (H/P) polypeptides or peptides comprises the histidine-proline-rich (H/P) polypeptides or peptides changes the histidine-proline-rich (H/P) compained angiogenesis, and the profession or endothelial tube formation in vitro or a pertapeptide having the generic sequence given in ABBT9808.

Also claimed are: chemically synthesised or recombinantly produced peptide multimers; a diagnostically or therapeutically labeled anigogenic polypeptide, peptide or peptide multimer; a diagnostically useful HFRG-related composition, comprising the diagnostically labeled or useful HFRG-related composition, comprising the diagnostically labeled or useful HFRG-related composition, comprising the diagnostically labeled or specific for an epicope of HFRG that is present in the H/P domain of specific for an epicope of HFRG that is present in the H/P domain of peptide than an entided or the domain, or an antiger-binding fragment of the antibody; a method for thibiting a method for inhibiting or an entider-binding fragment of the antibody; a method for inhibiting a condition associated with undesired cell migration, invasion, cell migration, cell migration, invasion, condition associated with undesired cell migration or angiogenesis, a method of stimulating the presence of HFRG or trelating a subject, a method of stimulating the presence of HFRG or trelating to a cell, tissue or organ an antiogenesis—inhibition and coding condition and method or transfected cells, a method of HFRG or the peptide or peptide multimer, immobilised to a sold support or carrier; and a method of isolating with un
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       invasion, proliferation, or angiogenesis, such as cancer, atherosclerosis, diabetic retinopathy, inflammation, endometriosis, atherosclerosis, diabetic retinopathy, inflammation, endometriosis, arthritis, peptic ulcers, or fractures. HPRG is especially useful in inhibiting the growth of primary tumours or metastases, and may also be used in treating neurodegenerative diseases like Alzhelmer's disease, parkinson's disease and amyotrophic lateral sclerosis. The antibodies are stimulators of angiogenesis and are useful for promoting neovascularization in pertinent disease states, and in various
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               890 HGHPPHGPPPHGHPPHGHPHGHGFHDHGPCDPPSHKEGPQDLH-QHAMGPPPKHPGKRGPGKGH 448

The invention provides thrombospondin (TSP)-binding molecules and fragments comprising regions of the TSP-1 binding domains of Histidine-Richycoproteins (HRCP). The proteins are used for the regulation of cellular growth and proliferation, such as in the accretion of new blood vessels (angiogenesis), particularly for treatment of cardiovascular disease. They may be used for the reduction of angiogenesis, including growth suppression and arrest, and apoptosis in normal development, for example in embryogenesis, and in a wide range of disorders and diseases, including those involving tumours, malignancies, neoplastic and other pathological conditions and homeostatic imbalances in the control of growth and development, in particular anal cancer, bladder cancer, small call lung cancer, nor-small cell lung cancer, brace cancer, cancers cell adenosarcoma (DES), colorectal cancer, chondrosarcoma, class cancer, carvical cancer, chondrosarcoma, class cancer, carvical cancer, chondrosarcoma, class cancer, evenical cancer, chondrosarcoma, class cancer, leukemia, liver cancer, lumphoma, mesothelioma, oral cancer, voarian cancer, lumphoma, mesothelioma, oral cancer, ovarian cancer, stonach cancer, tryproid cancer, orangers cancer, skin cancer, squamous cell cancer, stonach cancer, testicular cancer, thyroid cancer, new cancer, lumpsarcoma, head and neck cancer and a cholangiocarcinoma. The present cancer represents the TSP-binding motif of HRGP

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGN primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). (II) the polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity amino acid sequences of the invention.                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGK) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed carvity of is useful in gene therapy techniques to restore normal carvity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this parent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at

One is associated with what is referred to as "knobby phenotype" (K30) and "knobless phenotype" (K.). The "knobby" and "knobless" phenotypes have been implicated in cytoadherence, which is characteristic of erythrocyte infection. It has now been found that cDNA expressing both K+ and K-HisRP can be obtained by the use of P. lophurae HisRP expressing DNA. The genomic clone (AAQ25532) is encoded in two exons, separating the signal peptide-encoding sequence from the pro-sequence, confirming that synthesis of the protein course via the preproprotein. Oligo, probes synthesised to the signal peptide-encoding exon reveal multiple

                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed sequence tags for identifying expressed activity of (II) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | | | : | | : | | : | | | : | | | PGHHGHRSPAQATTSTGHTGTHRTGHHTGHHTGHRSPAQATTSTGHTSTGHTGHRTSTGHHTGHRSPAQHTSTGHTSTGHTGHTGHTGHTGHTGHRSPAQ----- 344
responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the product of the product 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PGHIRRRGPGKGP------RPF------HCRQIGSVYRLPPLRKGEVLPL 123

genes. (I) is useful in gene thereby techniques to restore normal cartifuty of (II) or to treat dieease states involving (II). (II) iss useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in polypeptide and polymucleotide sequences have applications in casponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this placetonic format directly from MIPO at electronic format directly from MIPO at the was obtained in the printed specification, but was obtained in the published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain

creaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in degrostics as expressed sequence tags for identifying expressed control is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful in generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from MIPO at the printed specification, but was obtained in electronic format directly from MIPO at (II). The printed specification, but was obtained in the printed specification, but was obtained in the printed specification.

CT The present invention relates to human single exon nucleic acid probes CC (SENP: see AAI10068-AAI20459). The present sequence is a peptide encoded CC (SENP: see AAI10068-AAI20459). The present sequence is a peptide encoded CC by one such probe. The SENPs are derived from human HeLa cells. The SENPs C can be used to produce a single exon microarray, which can be used for CC measuring human gene expression in a sample derived from human cervical CC epithelial cells. By measuring gene expression, the probes are therefore UCC cervical cancer. Note: The sequence data for this patent did not form CC part of the printed specification, but was obtained in electronic format CC directly from WIPO at ftp.wipo.int/pub/published_pct_sequences SQ Sequence 292 AA;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SUBCELLULAR LOCATION: Secreted.
TISSUE SPECIFICITY: Expressed by the liver and secreted in plasma.
DOMAIN: In addition to having a high His and Pro content, this protein has many internal repeats. 15 tandem repetitions of a 5-
residue sequence (G[H/P][H/P]PH, consensus) form a His/Pro-rich
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ----- РИЕНОТИКОНРИСИИРИСИИР
                                                                                                                                         glycoprotein.";
Biochmeistry 35:1925-1934(1996).
-!- FUNCIION: The physiological function is not yet known. It binds heme, dyes and divalent metal ions. It can inhibit rosette formation and is known to interact with heparin, thrombospondin, and the lysine-binding site of plasminogen. On the basis of its homology with HWW kninogen, the His-rich region of this protein may mediate the contact activation phase of intrinsic blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

**Determination of the disulphide bridge arrangement of bovine histidine—rich glycoprotein...;

**FEBS Lett. 328:286-290(1993).**

**L. FUNCTION: The physiological function is not yet known. It binds heme, dyes and divablent metal ions. It can inhibit rosette formation and is known to interact with heparin, thrombospondin, and the lysine-binding site of plasminogen. On the basis of its homology with HWW Kininogen, the His-rich region of this protein may mediate the contact activation phase of intrinsic blood coagulation cascade.

**CORTION'S Secreted bight His and Secreted in plasma.**

**CORTION'S Secreted bight His and Pro content, this protein has many internal repeats. 12 tandem repetitions of a 5-residue sequence (GHHPH, consensus) form a histidine-rich region.

Jubmitted (OCT-1998) to the EMBL/GenBank/DDBJ databases.
Jubmitted SUBCELLUIAR LOCATION: Integral membrane protein (Probable).
Jubmitted SPECIFFICITY: Expressed abundantly in embryonic carcinoma cells, but weakly in adult tissues.
Jubmitted States and States and States and States (TC 2.A.5) family.
KE4/Catsup subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

"Comprehensive isolation of meiosis-specific genes identifies novel proteins and unusual non-coding transcripts in Schizosaccharomyces
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic Acids Res. 29:2327-2337(2001).

-!- CATALYTIC ACTIVITY: Endohydrolysis of 1,4-alpha-glucosidic
-!- CATACTOR In Oligosaccharides and polysaccharides.
-!- COFACTOR: Binds 1 calcium ion per subunit (Potential).
-!- SIMILARITY: Belongs to family 13 of glycosyl hydrolases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            GeneDB SPombe; SPBG16A3.13; --

Murray B.W., Stelltmann H., Klein J.;
"Identification of a homolog of the human HKE4 gene in zebrafish.";
Submitted (OCT-1999) to the EMBL/GenBank/DDBJ datebases.
-!- SUBCELLULAR LOCATION: Integral membrane protein (Probable).
-!- SIMILARITY: Belongs to the ZIP transporter (TC 2.A.5) family.
KE4/Catsup subfamily.
                                                                                                                                                                                                                                                                                                     (POTENTIAL).

Patent No. 6274345

GENERAL INFORMATION:

Patent No. 6274345

GENERAL INFORMATION:

APPLICANT: Choi, Jong Hyun

APPLICANT: Lee, Sang Yup

APPLICANT: Lee, Sang Yup

APPLICANT: Lee, Sang Yup

TITLE OF INVENTION: ENCODING OMPC DERIVED FROM B.COLI AS CELL SURFACE ANCHORING

TITLE OF INVENTION: MOTIF

TITLE OF INVENTION: MOTIF

TITLE OF INVENTION: WOTIF

TITLE OF INVENTION: WOTIF

TITLE OF INVENTION NUMBER: US/09/507,323B

CURRENT PELLIAG DATE: 1999-02-22

NUMBER OF SEQ ID NOS: 13

SOFTWARE: FastSEQ for Windows Version 4.0

SEQ ID NO 13

LENGTH: 167

TYPE: RET
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 GENERAL INFORMATION:
